

Data Structures and Algorithms

(CS210/ESO207/ESO211)

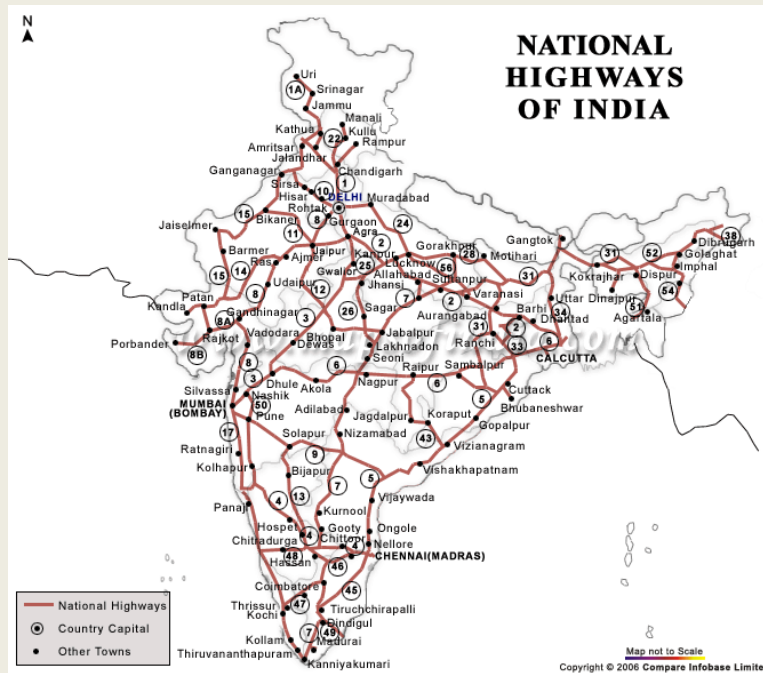

Lecture 21

Graphs

- Definitions, notations, and terminologies
- Data structures for graphs
- A few algorithmic problems in graphs

Why **Graphs** ??

Finding shortest route between cities

Given a network of **roads** connecting various cities, compute the shortest route between any two **cities**.

Just imagine how you would solve/approach this problem.

Embedding an integrated circuit on mother board

How to embed **ports** of various ICs on a plane and make **connections** among them so that

- No two connections intersect each other
- The total length of all the connections is minimal

A social network or world wide web (**WWW**)

Can we make some useful observations about such networks ?

diameter

degree distribution

How will you model these problems ?

Graph

Graph

Definitions, notations, and terminologies

Graph

A graph G is defined by two sets

- V : set of vertices
- E : set of edges

Question: any relation between E and V ? $E \subseteq (V \times V)$

Notation:

- A graph G consisting of vertices V and edges E is denoted by (V, E)

Types of graphs

Undirected Graph

$$V = \{1, 2, 3, 4, 5, 6\}$$

$$E = \{(1, 2), (1, 5), (2, 5), (2, 3), (3, 4), (4, 5), (4, 6)\}$$

Directed Graph

$$V = \{0, 1, 2, 3, 4, 5\}$$

$$E = \{(0, 1), (0, 4), (1, 2), (2, 0), (2, 1), (3, 2), (4, 5), (5, 4)\}$$

Notations

Notations:

- $n = |V|$
- $m = |E|$

Note: For directed graphs, $m \leq n(n-1)$

For undirected graphs, $m \leq n(n-1)/2$

Walks, paths, and cycles

Walk:

A sequence $\langle v_0, v_1, \dots, v_k \rangle$ of vertices is said to be a **walk** from x to y if

- $x = v_0$
- $y = v_k$
- For each $i < k$, $(v_i, v_{i+1}) \in E$

Path:

A walk $\langle v_0, v_1, \dots, v_k \rangle$ on which no vertex appears twice.

Cycle:

A walk $\langle v_0, v_1, \dots, v_k \rangle$ where no **intermediate** vertex gets repeated and $v_0 = v_k$

Terminologies

- $\langle 1, 5, 4 \rangle$ is a **walk** from 1 to 4.
- $\langle 1, 3, 2, 5 \rangle$ is not a **walk**.
- $\langle 1, 2, 5, 2, 3, 4, 5, 4, 6 \rangle$ is a **walk** from 1 to 6.
- $\langle 1, 2, 5, 4, 6 \rangle$ is a **path** from 1 to 6.
- $\langle 2, 3, 4, 5, 2 \rangle$ is a **cycle**.

Terminologies

two vertices are said to be *connected* if there is a **path** between them.

Connected component:

A **maximal** subset of connected vertices

You can not add any more vertex to the subset and still keeping it connected.

Data Structures for Graphs

Vertices are always numbered

$1, \dots, n$

Or $0, \dots, n - 1$

Link based data structure for graph

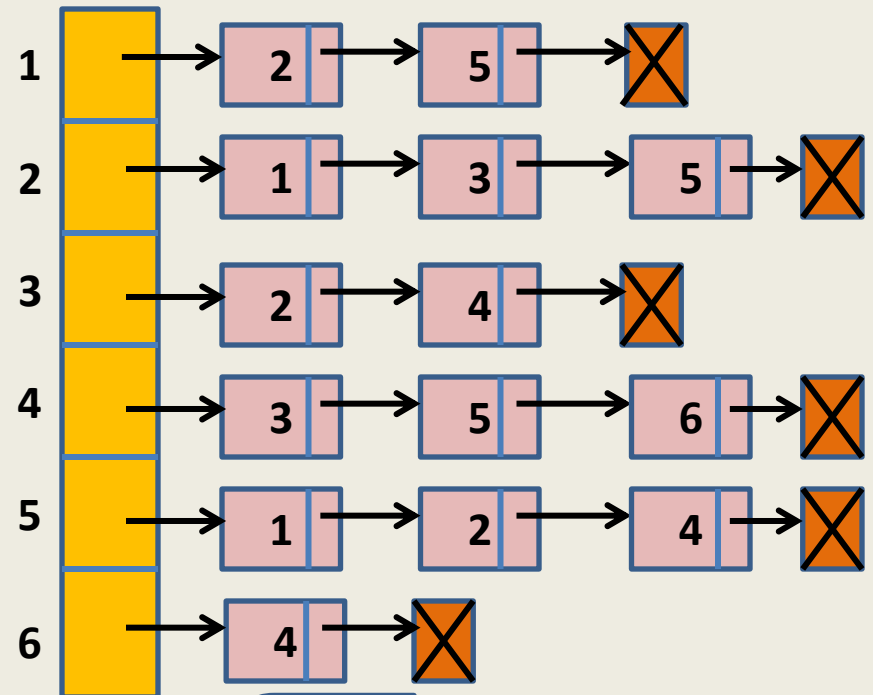

Undirected Graph

$V = \{1, 2, 3, 4, 5, 6\}$

$E = \{(1, 2), (1, 5), (2, 5), (2, 3), (3, 4), (4, 5), (4, 6)\}$

Adjacency Lists

Size = $O(n + m)$

Link based data structure for graph

Advantage of Adjacency Lists :

- Space efficient
- All the neighbors of a vertex can be computed in optimal time.

Disadvantage of Adjacency Lists :

- How to determine if there is an edge from x to y ?
($O(n)$ time in the worst case).

Array based data structure for graph

Undirected Graph

$V = \{1, 2, 3, 4, 5, 6\}$

$E = \{(1, 2), (1, 5), (2, 5), (2, 3), (3, 4), (4, 5), (4, 6)\}$

Adjacency Matrix

| | 1 | 2 | 3 | 4 | 5 | 6 |
|---|---|---|---|---|---|---|
| 1 | 0 | 1 | 0 | 0 | 1 | 0 |
| 2 | 1 | 0 | 1 | 0 | 1 | 0 |
| 3 | 0 | 1 | 0 | 1 | 0 | 0 |
| 4 | 0 | 0 | 1 | 0 | 1 | 1 |
| 5 | 1 | 1 | 0 | 1 | 0 | 0 |
| 6 | 0 | 0 | 0 | 1 | 0 | 0 |

Size = $O(n^2)$

Array based data structure for graph

Advantage of Adjacency Matrix :

- It takes $O(1)$ time to determine whether there is an edge from x to y for any two vertices x and y .

Disadvantage of Adjacency Matrix :

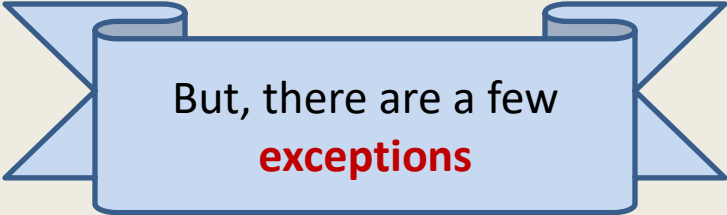

- It takes $O(n)$ time to compute/enumerate all neighbors of a given vertex x .
- It takes $O(n^2)$ space.

Which data structure is commonly used for storing graphs ?

Adjacency lists

Reasons:

- Graphs in real life are sparse ($m \ll n^2$).
 - Most algorithms require enumerating and processing neighbors of each vertex.
- Adjacency matrix will enforce $O(n^2)$ bound on time complexity for the algorithm.

But, there are a few
exceptions

A sample of Graph algorithmic Problems

- Are two vertices x and y connected ?
- Find all **connected components** in a graph.
- Is there is a **cycle** in a graph ?
- Compute a **path of shortest length** between two vertices ?
- Is there is a **cycle passing through all vertices** ?

An interesting problem

(Finding a **sink**)

A vertex x in a given directed graph is said to be a **sink** if

- There is no edge emanating from (leaving) x
- Every other vertex has an edge into x .

Given a directed graph $G=(V,E)$ in an **adjacency matrix** representation, design an $O(n)$ time algorithm to determine if there is any **sink** in G .
